Name: ATIA KWEKU

Age: 34 yrs

Gender: Male

Clinical History: sudden onset of left arm swelling. r/o DVT of left upper limb

Indication: LEFT UPPER VENOUS DOPPLER

Type of Investigation: Vascular Ultrasound

Investigation Date: 05/10/18

UPPER LIMB VASCULAR DOPPLER STUDY

The veins of the left upper limb namely the subclavian, brachial and cephalic veins as well as the basilic, axillary, ulnar and radial veins are patent with normal color flow on Doppler assessment. They compress adequately with pressure and demonstrate normal phasic Doppler flow waveform on spectral. The veins respond normally to Valsalva and augmentation. No luminal irregularities or echogenic filling seen.

The accompanying arteries are unremarkable.

No significant soft tissues edema noted.

No obvious enlarged lymph nodes seen.

Impression:

1. Normal venous Doppler study of the left upper limb
2. No thrombosis involving the veins of the left upper extremity have been demonstrated
