Age:27yrs

Gender:Female

Clinical History: General Breast Lumpiness

Type of Investigation: Breast Ultrasound

Investigation Date:19/1/2/2017

ULTRASOUND REPORT

There are two small well-defined solid masses at the 9 O'clock and 3 O'clock regions of the right breast, about 2cm and 4cm from the nipple measuring 1.2x0.5cm and 0.8x0.4cm respectively.

Also noted in the contralateral breast are two similar lesions at the 1:30 and 12 O'clock regions, at the sub-areolar and about 3cm from the nipple measuring 1.2x0.4cm and 0.6x0.4cm respectively.

The masses are wider than tall and show increase through transmission.

No sonographic evidence of abscesses.

No calcification or dilated intramammary ducts noted bilaterally.

Normal overlying skin thickness.

Also noted at both axillae are multiple benign-appearing lymph nodes.

Impression:

- Bilateral Fibroadenomata;
- Bilateral Axillary Lymphadenopathy.

Sonographer: Rosemond Adu-Sarkodie
