

## THE TRUST HOSPITAL ULTRASOUND REPORT

P.O. BOX M149, Accra, Tel: 00233-21-761975-8, Email: [snithosp@4u.com.gh](mailto:snithosp@4u.com.gh)

NAME: DR. HENRY AGORTEY

AGE: 29 YRS

SEX: MALE

INVESTIGATION: ULTRASOUND SCAN – RIGHT ANKLE

REQUEST DATE: 28/08/18

EXAMINATION DATE: 28/08/18

CLINICAL HISTORY: RIGHT ANKLE PAIN .R/O LIGAMENTOUS OR TENDON INJURY

REF HOSPITAL/DOCTOR: GILEAD MEDICAL CENTRE

### REPORT

*There is mild enlargement of the lateral group of tendons (compared to the left), specifically the peroneal tendon with associated mild to moderate oedema of the soft tissues overlying the lateral maleolus and posterolateral aspect of the distal leg. There is no suggestion of discontinuity in the fibres of the affected tendon . The calcaneofibular ligament is relatively normal.*

The medial group of tendons show normal size and echopattern.

The anterior group of tendons show normal size and echopattern.

The posterior group of tendons show normal size and echopattern.

The demonstrated tibiotalar joint space is normal.

The articular surfaces of the bones forming the joints are grossly normal.

The adjacent vessels are grossly normal.

No joint effusion seen.

### Impression:

- Inflammatory changes involving the right peroneal tendon with associated mild to moderate oedema of the soft tissues overlying the lateral maleolus and distal leg.
- No sonographic evidence of tendinous or ligamentous tear.

*MRI of the ankle joint is however suggested in the further evaluation of this patient if concerns persist.*
