Investigation**AFP-Alpha Feto Protein**
(Serum)**Observed Value**

0.30

Unit

IU/mL

Biological Reference Interval

0-5.8

Interpretation:

1. The primary malignancies associated with AFP elevations are hepatocellular carcinoma and non-seminomatous germ cell tumors. Other gastrointestinal cancers like gastric, pancreatic occasionally cause elevations of AFP. Multiple benign disorders like cirrhosis, viral hepatitis, pregnancy are associated with AFP elevations. Level above which benign disease is considered unlikely is 500 ng/ml.
2. Range for newborns is not established, however neonates have elevated AFP levels ($>100,000$ ng/mL)(conversion $1 \text{ IU/ml} \times 1.21 = 1 \text{ ng/ml}$) that rapidly fall to below 100 ng/mL by 150 days & gradually return to normal by one year.
