Job Number: 100051193

<b>Patient:</b>	MARY ASIEDU	<b>Requester:</b>	EXTERNAL EXPHYC PHYSICIAN
<b>Patient Number:</b>	1032367	<b>Patient Type:</b>	
<b>Date of Birth:</b>	1958/01/01		

**Study:** CT Abdomino-Pelvic + IV and Oral Contrast

## Clinical Information:

### Report:

Serial axial CT scan images of the abdomen and pelvis through the lower thoracic segment show no pericardial effusion or pleural effusion. Images depict multiple varying size hepatic micro cyst . No abnormal enhancement is seen. There is moderate hepatomegaly. No subcapsular effusion. Cuts show normal pancreas with normal spleen, adrenal glands, kidneys, gall bladder and retroperitoneum . Hepatic hilum show gaseous colonic bowel loops that extends into the right iliac fossa. Images also depict mesenteric fat tissue along tissue adjacent the bowel that extends even into the anorectal region. Cuts show normal urinary bladder with normal uterus. There is no ascites or mass lesion. Severe disc disease is seen at L5/S1. Cuts show no paravertebral abnormalities or lumbar mass lesion. Bowel loops are seen in the iliac fossa towards the bladder.

### Imp:

Hepatomegaly with micro cyst formation and evidence of gaseous bowel loops seen more along the hepatic hilum and the iliac fossa on the right. Changes are seen with mesenteric fat . No mass lesion or urolithiasis. Cuts also show no lymphadenopathies.
