CT angiography of the chest with intravenous contrast

Clinical history: Pulmonary thromboembolism.

Technique: 5 mm axial sections from the base of the neck to the upper abdomen are obtained with intravenous contrast. Sagittal and coronal MIPs are also obtained.

**Findings:**

No filling defect is seen within the pulmonary artery divisions to suggest pulmonary embolism. No mediastinal mass or lymphadenopathy is seen. No pericardial effusion is seen. The aorta is unremarkable.

The lungs are clear. No pleural effusion or pneumothorax is seen.

Abdominal viscera included in the submitted images are unremarkable.

The osseous structures are unremarkable.

**Impression:**

No evidence of pulmonary embolism or other acute intrathoracic pathology.
